

Saga Family Lifecycle Atlas

Operator journey, command routing, durable artifacts, state maturity, gates, and plugin ownership

Generated from scripts/build_saga_docs_facts.py and active Codex plugin manifests

Main Chain

idea-ready/requirements-ready -> saga:plan -> saga:doc-review -> saga:work -> saga:code-review -> saga:qa -> saga:handoff or saga:retro

Mutation Boundary

Saga routes and records context. Mission Control mutates SDLC state, Team Execution owns review evidence, and Deploy owns tags.

Read left to right. A hard gate blocks the next step; an advisory step improves context without owning mutation.
